Abstract:

The MediVault is a secure, all-in-one digital healthcare management platform designed to simplify and streamline the handling of medical records, health reminders, diagnostic data, and insurance processes across the healthcare ecosystem. Built using reliable and scalable technologies such as React.js, Node.js and MongoDB, MediVault enables patients, doctors, hospitals, diagnostic centers, and insurers to seamlessly access and share critical health information through a unique patient ID while ensuring data privacy and compliance with healthcare security standards. The platform eliminates paper-based records, reduces administrative delays, enables automated medication and follow-up reminders, and accelerates insurance claim processing through real-time verification. By enhancing doctor– patient communication, supporting timely medical interventions, reducing healthcare costs, and promoting eco-friendly paperless operations, MediVault delivers strong social, economic, and environmental impact making healthcare faster, smarter, and more accessible.
